PLANTING INSTRUCTIONS:

When to Plant. As early as possible after the first killing frost.

Care of Trees on Arrival. If not ready to plant immediately, dig a trench, unpack the trees and heel in, cover the roots with earth, and water freely.

Preparing the Trees for Planting. Remove all broken roots. Cut back one-year peach, apple, cherry, pear and plum trees to a naked stem, $1\frac{1}{2}$ to 2 feet high, leaving no side branches. Two-year-old trees should have branches cut back to half their length, the lower limbs shorter than those immediately above, then cutting them shorter as you go upward, leaving a long leader.

Preparing the Soil. Fruit trees succeed best in rich loam, naturally dry or made so by drainage. Make the holes at least 2 feet wide, and 2 feet deep. Cover the roots with surface soil, tamping thoroughly as the hole is filled. Use thoroughly rotted manure or bonemeal mixed with the soil. Do not put fresh manure around the roots.

Cultivation. Stir the soil frequently during the summer to conserve moisture and remove weeds. Cut suckers or branches that start below the head. Lime, bonemeal, or a high-grade commercial fertilizer may be used as required. Mulch trees at least for first and second years after planting.

JAPAN PERSIMMONS

The Japan Persimmon is thoroughly at home in the Cotton Belt. If the fruit is harvested before it is touched by frost, and house-ripened, the quality becomes greatly improved. Some varieties have dark flesh, which is edible while the fruit is still hard, but the light-fleshed varieties must be thoroughly matured before they can be eaten, as they are very astringent until fully ripened. The fruit of nearly every variety begins to color when half grown, but should be allowed to hang upon the trees until just before frost is expected, or in the case of early-ripening varieties, when fully matured. Many of the late ripening varieties can be kept until February. Distance for planting, 15 to 25 feet apart each way.

BERRIES

BLACKBERRIES

Blackberries do their best in a strong loam. Fertilizers containing a good proportion of potash are the most desirable. To prevent rust, spray with copper-sulphate solution during fall and winter, and with

Bordeaux Mixture (4-6-50) during spring and summer. The rows should be 6 to 8 ft. apart and the plants from 3 to 4 ft. in the row. Apply fertilizer during the late winter and give shallow and constant cultivation.

Eldorado. The large berries, borne in big clusters. Very sweet—no core. A heavy bearer.

Himalaya. Strong grower; very prolific. Should be grown on trellis.

BOYSENBERRY

Very large fruit with delicious flavor. Most prolific. Highest quality.

DEWBERRIES

Use short, stout stakes, driven at the end of each row of canes, with a cross-piece of 18 in. long nailed to each stake, 2½ to 3 feet from the ground. On the top, near each end of these cross-pieces, drive a stout nail, slanting toward the stake, upon which to catch a wire. Two lines of No. 14 galvanized wire, one on each side of the row, are fastened to one end of the stake and run on the ground between the rows to the other end stake. Draw wires as taut as possible, and securely fasten to the other end of the row. The wires are now raised and caught on the nails, thus holding all the canes closely together in the row. Dewberries should be mulched to keep the berries from the ground.

Austin's Improved. Very large fruit. Vigorous grower; productive. The best variety for the South.

Lucretia. Low-growing. Hardy and very productive. Fruit sweet and luscious. Early.

RASPBERRIES

The lighter loams are best for the red sorts, and the heavy loams for the blackcaps. Cottonseed meal, pure ground bone, or fertilizers containing a good proportion of potash are best and should be liberally applied during the winter and early spring. Keep the plants in vigorous condition; mulch heavily with straw.

Cumberland (Black). Very large, firm berries of high quality. The best mid-season market variety.

Cuthbert (Queen of the Market). The best and most reliable of the red-fruited varieties. Fruit large, red, and of excellent quality; ripens middle of May. Prolific bearer. Fine shipper.

Latham. Large; red; luscious. Very productive. Splendid shipping qualities.

Ranere (St. Regis). Berries large, crimson; flesh rich. Prolific. Produces its fruit early and through a long period. We consider it one of the best raspberries.

STRAWBERRIES

Blakemore. Uniformly large, bright red berries. Early. Good bearer.

Klondyke. Large, firm berries. A profitable variety. Early bearing on vigorous, upright growth.

ABOVE TWO VARIETIES \$2.00 per 100.

YOUNGBERRIES

Youngberries. Fruit larger than dewberries, with a decided flavor of raspberry. Splendid for home use, but will not ship well.

PRICE ON ALL ABOVE BERRY PLANTS (except Strawberries) 15c each; \$1.25 per 10; \$10.00 per 100

PECANS

Plant pecans 50 to 60 feet apart, according to soil, which should be good.

A sour soil will kill or injure the trees and never be satisfactory. To get crops, you must cultivate, fertilize, and properly prune the trees. Our trees, if properly cared for, should bear in five years, bear paying crops at eight years, and should produce 16-20 pounds of nuts per tree at 10 years.

Planting and Cultivating. After pecans reach maturity in fall, transplant any time until March. Keep roots covered with moss or wet sacks at all times before planting—they must not dry out. Dig hole for tree before exposing roots. Hole should be 2 feet wide and deep enough to set tree a trifle lower than it stood in nursery.

Fill hole half full around roots with well-pulverized top-soil enriched with either the proper amount of well-rotted stable manure, bonemeal, or high-grade fertilizer, thoroughly mixed with the soil.

Pack earth firmly as the hole is filled, but leave 2 inches of loose soil on top. When soil is very dry, pour water in the hole when partly filled. Be careful not to break eyes of trees when handling. Keep trees cultivated and properly pruned. Between the rows you may plant cover-crop for several years, but never small grain. When trees go into bearing, plant and turn under a cover-crop of soy beans, vetch or clover.

Mahan. Extra-large nut; thin shell; delicious meat. Very desirable. Each

CULTURE OF CAMELLIA JAPONICA

Camellias will grow in full sun if protected for the first few summers with a lattice frame. However, an ideal place for planting is where the plants get only a half day's sun. Do not plant in full shade, as they will not blossom as freely. If the soil is not fertile, use the following mixture: one-half good garden soil; one-fourth well-rotted cow manure; one-fourth peat or leaf-mold, well mixed. After planting, mulch with half-rotted leaves or peat. Each spring Camellias should be fertilized with well-rotted cow manure and A-C fertilizer. Keep the plants well mulched and watered.

The foliage is sometimes attacked by a scale-insect, which may be readily controlled by spraying with Volck. Be sure to wet the underside of leaves. This spray material may be found on pages 55-56 of our catalogue.
